

# Firmex API: Integrate and Automate With Your Virtual Data Room

## Our API

The Firmex application programming interface (API) enables developers to integrate their Firmex virtual data room (VDR) with existing third-party enterprise systems.

## Helping Your Organization Work Better

Save your teams from the time and manual labour of working between applications.

Connect to the Firmex API and empower your internal developers and IT teams to sync your organization's suite of applications with your VDR. Better streamline and automate your workflows, and increase efficiency with Firmex.

## Seamlessly Sync Documents

Ensure documents are instantly available across multiple applications. The Firmex API can allow VDR users to sync files across Firmex and other third-party applications, minimizing the turnaround time for sharing and reviewing key documents with interested parties.

## Keeping Data Secure

The Firmex API leverages our virtual data room's world-class security and compliance protocols that ensure your data is safe, confidential, and secure.

## Doing More With Your VDR

### MANAGE USERS

The Firmex API can also help host admins manage users across their VDRs and other third-party apps by automating the process of provisioning and deprovisioning users. Users can be quickly added to the VDR, with less room for manual error (e.g., inputting the wrong email address).

### ENHANCED REPORTING

Using the Firmex API, data is made readily available between connected applications. Data can be quickly pulled, saving host users from manually combining multiple information sources to generate reports.

### PROJECT CREATION

The Firmex API allows host admins to create and update projects on the go, so teams can create new projects easily, without logging into Firmex.

## Connect to the Firmex API Today

For more information or to connect with our API, please reach out to your Success Manager or [customersuccess@firmex.com](mailto:customersuccess@firmex.com) for more details.
